

CANNABIDIOL (CBD) FOR THE TREATMENT OF DIABETIC PERIPHERAL NEUROPATHY STUDY

We are conducting a trial to better understand the efficacy of cannabidiol for the treatment of pain and discomfort caused by diabetic neuropathy

DETAILS

Only patients with mild to moderate DPN are eligible. Those with severe heart, lung, or liver disease, and those using certain medications, may not qualify.

Volunteers will be screened to make sure that they are eligible for the study. This will include testing of liver function and may include a pregnancy test for women.

The CBD tincture will be supplied at no cost to the participant.

This study is sponsored by the Florida A&M University, College of Pharmacy and Pharmaceutical Sciences Institute of Public Health.

WHO CAN PARTICIPATE

Adults with type 2 diabetes who have mild to moderate diabetic peripheral neuropathy (DPN).

Participants must be English proficient. Pregnant women are not eligible.

WHY PARTICIPATE

The study will test the use of an over-the-counter hemp extract. It may help provide relief from DPN. Thus, you may benefit from the use of the extract.

Contribute to Research: The data generated will help doctors better understand if CBD or full-spectrum CBD helps in neuropathy.

INCENTIVE

Participants who complete the first treatment phase will receive a \$150.00 gift card for Walmart. Participants who complete the second phase and complete the study will receive an additional Walmart gift card, this one for \$250.00

HOW TO PARTICIPATE

Tell your doctor or other staff member at the FSU TMH Family Practice Residency Program that you are interested in participating in the DPN Study. If interested in participating, call 850-431-4947.
